Stopping Criteria

[1] Total Error = zero (Theoretical)

[2] Total Error < certain value (Threshold)

[3] Percentage Change of Weights is less than certain value (Threshold)

[4] Reach Maximum number of iterations (Epochs) without satisfying [2] or [3]

Stopping is due to reaching Maximum number of iterations = Training is FAILED

Expected Reasons:

[1] The defined Maximum Number of Epochs is small. Try to increase the limit

[2] Under-fitting (Training samples are not adequate). Try to provide more training samples

[3] Model Design is not suitable to training data. Try to add more nodes in hidden layer or add more hidden Layers

[4] Data is NOT separable by Neural Network. Try Another Models (e.g. SVM with Kernels)
